<http://www.isi.edu/robots>

- Mission
 - To build Self-Reconfigurable Systems such as metamorphic robots, agents, and smart structures that go where biological systems have not gone before!!!
- Projects and Awards
 - YODA (1996) The 2nd place in AAAI competition
 - Dreamteam (1997) RoboCup World Champion
 - Intelligent Motion Surface in MEMS (1996-98)
 - CONRO Self-Reconfigurable Robots (1998-)
- People, Robots and Facilities
 - Experienced and talented research team
 - 3 Denny robots, 5 SoccerBots, 18 CONRO modls
 - Large labs and workshops, many instrumentations

Outline

- Motivation for Self-Assembly in Space
- Three Enabling Technologies
 - Based on Self-Reconfigurable Robots
- Proposed Evaluation Experiments
- Research Plan for SSPS
- Future Directions

Motivation for Self-Assembly

- Cost Effective
 - For a 10KM SSPS
 - >2,500 hours of astronaut space walk
 - 4/11/2002, girder assembly (2*6 hours)
 - >\$3 billion for assembly cost
- Feasible Strategy
 - Most jobs by self-assembly
 - Critical jobs done by astronauts

A Vision for Space Self-Assembly

Three Enabling Technologies

- Intelligent and Reconfigurable Component (IRC)
 - Can *free-float* and *dock* to form structures
- Free-flying Fiber Match-Maker Robots (FIMER)
 - Can *search*, *navigate*, *bring-together* and *dock* IRCs
- Distributed Process Controller (DPC)
 - Can *plan* self-assembly in a distributed manner and *recover* from unexpected situations

Self-Reconfigurable Robots

CONRO Self-Reconfigurable Modules

A network of physically coupled agents
Self-assembling into various configurations!

“Live Surgery” Reconfiguration

Beyond-Bio Self-Reconfiguration

Challenges in Control

- Distributed
 - Autonomous modules must be coordinated by local configuration information (no unique IDs or brain modules)
- Dynamic
 - Network and configuration topology changes
- Asynchronous
 - Communication with no real-time clocks, global or local
- Scalable
 - Weak local actions vs. grand global effects
- Fault-tolerant
- Miniature and self-sufficient

Related Work

- Self-Reconfigurable robots

- Diffusion-reaction (Turing 52)
- Cebots (Fukuda Nakagawa90)

- Decentralized and autonomous system (Mori84)
- Homeostatic control for resource allocation (Arkin88)
- Dynamic topology network (Si&Lin2000)

Digital Hormones

- Content-based messages
 - No addresses nor identifiers
 - Have finite life time
 - Trigger different actions at different sites
- Floating in a global medium
 - Propagated, not broadcast
 - Internal circulation, not external deposit (pheromones)
- Preserve local autonomy for individual sites
- Hormones can modify module behaviors (RNA)

Mechanical Cells (M-Cell)

The Uses of Digital Hormones

- Communication in dynamic network
- Cooperation among distributed autonomous modules
 - Locomotion
 - Reconfiguration
 - Synchronization
 - Global effects by weak local actions
 - Conflict resolution (multi hormone management)
 - Navigation
- Shape adaptation and self-repairing

Hormones for Caterpillar Move

- A simple one-pass hormone from head to tail
- Controls and synchronizes all motor actions
- Independent from the length of the snake

Reconfigure Insect → Snake

Hormone Activities

Active hormones

Actions

LTS	Start the reconfiguration
$RCT_1, RCT_2, RCT_3, RCT_4$	Legs are activated
TAR, RCT_2, RCT_3, RCT_4	The tail inhabits RCT, and leg1 determines RCT_1
ALT, RCT_2, RCT_3, RCT_4	The tail assimilates leg1 and then accepts new RCT
TAR, RCT_2, RCT_4	The tail inhabits RCT, and leg3 determines RCT_3
ALT, RCT_2, RCT_4	The tail assimilates leg3 and then accepts new RCT
TAR, RCT_2	The tail inhabits RCT, and leg4 determines RCT_4
ALT, RCT_2	The tail assimilates leg4 and then accepts new RCT
TAR	The tail inhabits RCT, and leg2 determines RCT_2
ALT	The tail assimilates leg2 and then accepts new RCT
\emptyset	End the reconfiguration

Autonomous Docking

- A great challenge for self-reconfiguration
- Require precise sensor guidance
- Demand precision movement
- Complex dynamics in micro-gravity environment

-
-
-

Intelligent Reconfigurable Components

An IRC has (1) a controller, (2) a set of named connectors, (3) wireless communication, (4) self-locating system, and (5) short-range sensors for docking guidance

Reconfigurable Connectors

1999

2001

2003

FIMER Robots

- Two-headed fiber/rope
- Free-flying head (6DOF)
- Navigate and dock to the connectors
- Rail-in fiber to bring parts together
- Simple arms to assist dock
- Onboard power or refuel capability

FIMER Dynamics and Control

Find relevant connectors based on their location information
Railing in the fiber only when there is no tension

Research Issues:

- * Dynamics of tethered objects in zero-gravity environment
- * Speed control
- * Collision control
- * Prevent tangling

The Global Process Control

- How do modules know *when* and *where* to connect?
- Advantages for distributed control
 - Coordination of autonomous modules without fixed brain
 - Support dynamic configuration topology
 - Asynchronous: communication without global clocks
 - Scalable: support growing structures
 - Fault-tolerance
 - Self-repairing capability
 - Self-replanning for unexpected events

Proposed Process Control

- Assumptions
 - Modules have unique identifiers
 - Assembly sequence embedded in modules
- Procedures
 - Activate self when receiving a call for its ID or type
 - Call FIMER robots to assist docking (when activated)
 - Activate the next connectors to be docked

Proposed Experiments

- Build modules for autonomous planning, navigation, & docking
- “2D flight-test” on an air hockey table
- Extensible to future 3D flight-test in micro-gravity environment

Research Time Table

Task	Time
Computer Simulation	0-3 month 
Building 2D flight modules/robots	0-12 month 
Control framework and algorithms	6-24 month 
Forming simple 2D structures	12-24 month
